

Solana's Network Vulnerability Assessment Services

Overview

In today's complex and diverse threat environment, ongoing vulnerability assessments are critical to protect an organization's IT assets and maintain business continuity.

Solana's Vulnerability Assessment (VA) service will identify key information assets of your organization and pinpoint areas of security vulnerability that could pose a threat to your business operations. Solana's VA recommendations not only strengthen your IT security posture but also greatly reduce your security risk moving forward.

Benefits of a Solana vulnerability assessment include improved overall compliance, ongoing protection from cyber threats, and identification of high risk areas warranting attention.

Solana's VA service can be tailored to meet the needs of each client. Here is how it works:

- Information Gathering - work with the client to define the VA scope
- Network Review - conduct a review of the systems and network to be assessed
- Firewall Analysis - analyze your firewall architecture and rules .
- External Network - scan your external network servers and devices for vulnerabilities
- Internal Network - scan your internal network including hosts, servers, printers, IP phones and other devices to uncover vulnerabilities which can be exploited by cyber attackers.
- Reporting - analyze the results of the VA study and provide recommendations to mitigate your security risk.
- Recommendations - identify unacceptable risk, propose recommendations for additional security safeguards and risk mitigation strategy.

In addition, Solana offers focused VA studies on specific devices, technology and protocols including SCADA, IoT, Routers, Switches, PLCs, VoIP phones among others.

Solana Networks utilizes a combination of Commercial Off-The-Shelf (COTS) products and custom-tools to conduct its vulnerability assessments.

Solana has been assisting organizations with their IT security needs since 2003.
